

In a Java Salary class with `playerMonthlySalary` and `performanceBonus`, should `totalSalary` be entered manually by the user or calculated automatically? Explain how to keep `totalSalary` correct when either value changes.

Thought for a couple of seconds >

`totalSalary` should be calculated automatically, not entered manually. Since it is derived from `playerMonthlySalary + performanceBonus`, allowing manual input could create inconsistent data, such as a total that does not match its components.

Use one method to calculate the value:

```
<> Java   
  
private void calculateTotalSalary() {  
    totalSalary = playerMonthlySalary + performanceBonus;  
}
```

Call this method in the constructor and whenever either value changes:

```
<> Java   
  
public void setPlayerMonthlySalary(double playerMonthlySalary) {  
    if (playerMonthlySalary >= 0) {  
        this.playerMonthlySalary = playerMonthlySalary;  
        calculateTotalSalary();  
    }  
}  
  
public void setPerformanceBonus(double performanceBonus) {  
    if (performanceBonus >= 0) {  
        this.performanceBonus = performanceBonus;  
        calculateTotalSalary();  
    }  
}
```

```
private void calculateTotalSalary() {  
    totalSalary = playerMonthlySalary + performanceBonus;  
}
```

```
public void setPlayerMonthlySalary(double playerMonthlySalary) {  
    if (playerMonthlySalary >= 0) {  
        this.playerMonthlySalary = playerMonthlySalary;  
        calculateTotalSalary();  
    }  
}  
  
public double getPerformanceBonus() {  
    return performanceBonus;  
}  
  
public void setPerformanceBonus(double performanceBonus) {  
    if (performanceBonus >= 0) {  
        this.performanceBonus = performanceBonus;  
        calculateTotalSalary();  
    }  
}
```
