

My TrainingSessionList checks duplicate IDs only when adding a session. Is this enough if training IDs cannot be changed during update? Explain whether I need duplicate validation again in update().

In your current design, **you do not need duplicate ID validation in `update()`** if the Training ID cannot be changed.

Why?

When adding a session:

Java

```
private void add(Scanner sc) {  
    TrainingSession session = new TrainingSession();  
    session.input(sc);  
  
    if (findIndex(session.getTrainingId()) != -1) {  
        System.out.println("Training ID already exists.");  
        return;  
    }  
  
    sessions.add(session);  
}
```
