

My TrainingSessionList uses ArrayList<TrainingSession> and linear findIndex(trainingId) for add, search, update, and delete. Is this suitable for my current small Java console project, or should I replace it with HashMap?

For your current football management console project, ArrayList<TrainingSession> with a linear findIndex() is completely suitable and is probably the better choice unless your project requirements specifically emphasize efficiency or advanced collections.

## Why ArrayList is appropriate

Your current operations are:

Java

```
add()
search()
update()
delete()
```

using:

Java

```
private int findIndex(String id) {
    for (int i = 0; i < sessions.size(); i++) {
        if (sessions.get(i).getTrainingId().equals(id)) {
            return i;
        }
    }
}
```
