

My TrainingSession setters such as setTrainingDate(), setTrainingLocation(), and setTrainingTopic() currently assign values directly without validation. Should I reuse the same validation rules as inputDate() and inputText() inside setters?

Yes, from a pure encapsulation perspective, validation should ideally be enforced inside the setters, because setters are the gatekeepers for modifying an object's state.

However, for **your current console-based student project**, there are two reasonable approaches.

Current situation

Your setters look like:

```
Java

public void setTrainingDate(String trainingDate) {
    this.trainingDate = trainingDate;
}

public void setTrainingLocation(String trainingLocation) {
    this.trainingLocation = trainingLocation;
}
```
