

My TrainingSession class stores trainingDate as String but validates it with LocalDate.parse(). Should I keep String or change the field to LocalDate? Consider my current console CRUD code and future file saving.

For your project, I would recommend changing `trainingDate` from `String` to `LocalDate`, although keeping it as `String` is acceptable for a small console assignment.

Current design

You currently do:

```
</> Java
private String trainingDate;
```

but validate using:

```
</> Java
LocalDate date = LocalDate.parse(value, dateFormat);
```

and then store:

+ Hỏi bất kỳ điều gì
