

My current code requires numeric-only Training IDs because TrainingSession inherits inputNumericId() from ClubEntity. However, the project examples use IDs like TR01. How should I redesign ID validation without breaking Player, MatchRecord, Contract, and Salary classes?

This is a classic inheritance design issue.

The problem

Right now, TrainingSession inherits:

```
</> Java  
setId(inputNumericId(sc, "Training ID: "));
```

from ClubEntity (or through ClubRecord).

That means all subclasses are forced to use numeric IDs, such as:

```
1001  
1002  
1003
```

...
